With over 30 years of experience in the heavy duty trucking industry, United Pacific Industries understand the rigors and stresses that our products are subjected to on the road. It is our mission to provide our customers with products of superior quality and reliability. In achieving this goal, United Pacific only partners with manufacturing facilities that conforms to our quality control requirements and standards. Our manufacturing partners meet or exceed ISO-9001 requirements. In addition, United Pacific's manufacturing partners must be equipped on site to perform the following quality assurance tests:

- AGING TEST
- AIR TIGHT TEST
- DUST TEST
- FLUX TEST
- PHOTOMETRIC TEST
- PULL FORCE TEST
- RAIN TEST
- SALT SPRAY TEST
- SHOCK TEST
- TEMPERATURE TEST
- HUMIDITY TEST
- VIBRATION TEST

United Pacific's manufacturing partners must maintain a track record of consistent quality and low product failure rate. Furthermore, our internal quality control structure allows us to function as the final quality control station prior to shipping. With the assistance of 3D computer technology, United Pacific can adhere to strict quality control standards during prototype creation and the production process. Our engineers and technicians perform a battery of tests to ensure that our products meet the demands of today's drivers and our goal to be first in quality.

ABOUT US

DESIGN

Located near some of the nation's most progressive automotive design centers, United Pacific established the UP Design Studio in 2002 to consolidate our position as the design leader in the heavy duty trucking industry. UP Design Studio utilizes the latest generation of computer aided design (CAD) and studio/graphic software. The design studio is equipped with the newest computers and rapid prototyping systems. In addition, UP Design Studio is staffed by graduates from the nation's most prestigious design colleges.

Unlike our competitors, United Pacific's design and manufacturing capabilities mean that we carry more new and original items than our competitors. The establishment of the design studio will enable us to generate even more new products with significant shorter concept-to-shelf time. The reduction in development cost mean that we can develop products utilizing design based development processes. Design based product development allows United Pacific to create new product concepts based on designs incorporating driver demands and needs instead of economic considerations. United Pacific's emphasis on design distinguishes and positions us ahead of our competitors.

INNOVATION

Known as the leader in innovation, United Pacific is dedicated to be the first to bring new and exciting products to the market. United Pacific's global expertise allows us to search the globe for new ideas and concepts. Not only do we search the globe for new products, United Pacific invest a significant amount of resources into our own research and development efforts. With the assistance of advance 3D scanning technology, our engineers and designers can acquire accurate and precise data in seconds. The 3D data allows United Pacific to verify designs, perform quality assurance tests, and reverse engineer with unprecedented speed and accuracy. Digital inspection contributes to the early detection of shape problems, provides rapid feedback on design, and eliminates unnecessary work in downstream processes. Our rapid prototyping facility permits us to have a concept-to-shelf time of less than 5 months. In addition, United Pacific's 3D printing capabilities permit our designers to have physical models of their design concepts in hours. The physical models allow our designers and marketing staff to evaluate and test the viability of different design ideas. Our rapid prototyping facility allow United Pacific to compress design cycles, improve manufacturing planning, shorten concept-to-shelf time, most importantly, generate new and innovative products.

Product FYI

Bolt Pattern

The term "bolt pattern" refers to the spacing of the mounting holes/bolts at the end of the light bar. Bolt pattern measures the distance from center to center of each bolt as shown below. The light bar mounts to the frame of the truck through these bolts. Pre-drilled holes for mounting light bars and mud flap hangers exist on most trucks. Easiest mounting method is to match the bolt pattern on the light bar with the existing mounting holes on the frame of the truck. United Pacific offers four different bolt patterns.

Product FYI

Spring Loaded vs. Standard Light Bar

Spring loaded light bars and mud flap hangers integrate a heavy-duty internal spring that permits the light bar or hanger to bend when struck. The internal spring snaps the light bar or mud flap hanger back into position when the obstruction is clear. Depending on the force of the impact, spring loaded light bars and mud flap hangers may continue to function even with some minor physical damage. Severely damaged light bars and mud flap hangers should be removed or replaced immediately.

Standard Light Bars

The standard light bar has two internal bolts welded to a thick steel end plate to provide a secure attachment point.

Spring Loaded Light Bars

With two small springs under tension, spring loaded light bars can snap back into position after impact. Spring is not sold separately.

Spring Loaded Mud Flap Hanger

With only one large spring under tension, spring loaded mud flap hangers function like a spring loaded light bar, snapping the hanger back into position after impact. Spring is sold separately.
